

NORGANIX

The Biosecurity Solution for Concrete

1. As concrete cures, it develops open capillaries which are pathways to the interior
... **NORGANIX hydrates unused Portland to shut down open capillaries**
2. Water ingress through capillaries causes expansion, and then cracks and fissures
... **NORGANIX prevents water ingress to safeguard structural integrity**
3. Chemicals, acids, blood and fats can penetrate deep within concrete
... **NORGANIX actively purges impurities from within concrete**
4. Gasses and vapors, such as Radon and Methane permeate through capillaries
... **NORGANIX creates a permanent barrier that gasses cannot permeate**
5. Vapor emanations from below threaten surface bonding and destroy coatings
... **NORGANIX blocks vapor emanation, thereby enhancing the bond**
6. Bacteria, microbes and spores thrive deep within in the dark, moist capillaries
... **NORGANIX eliminates bacteria and spores and prevents their return!**
7. Disinfectants and solvents have molecules too large to penetrate open capillaries
... **NORGANIX is drawn deep into concrete for true "integral sealing"**

What lives in your concrete?
